## Water: Water Transport

### Submersible Pump in Discharge Tube

## Amacan P

#### Main applications

- Irrigation and drainage pumping stations
- Stormwater pumping stations
- Raw and clean water pumps in waterworks and waste water treatment plants
- Cooling water pumps in power stations and in industry
- Industrial water supply
- Water pollution and flood control
- Aquaculture

#### Fluids handled

- Waste water
- Sludge
- Surface water
- Stormwater
- Grey water
- Seawater
- Brackish water

#### Operating data

Operating properties

Characteristic	Value	
Flow rate	Q	Up to 7000 l/s
Head	H	Up to 12 m
Motor rating	P <sub>2</sub>	Up to 680 kW
Fluid temperature	t	Up to +40 °C
Enclosure	IP 68 to IEC 60034-5; explosion protection to ATEX II 2G T3 available	

#### Designation

**Example: Amacan PA4 800-540 / 120 6UTG1**

Key to the designation

	XA Explosion protection to ATEX (sizes 500-270 ... 600-350)
	UT Without explosion protection, standard (sizes 700-470 ... 1500-1600)
	XT Explosion protection to ATEX (sizes 700-470 ... 1500-1600)
<b>G1</b>	<b>Material variant</b> (⇒ Page 11)
	G1 Grey cast iron, standard material variant
	G3 Grey cast iron with Zn anodes, shaft made of 1.4057 stainless steel

#### Design details

##### Design

- Fully floodable submersible pump in discharge tube (submersible motor pump)
- Not self-priming
- Close-coupled design
- Single-stage
- Vertical installation

##### Drive

- Three-phase asynchronous squirrel-cage motor

Motors integrated in explosion-proof pump sets are supplied in Ex d IIB type of protection.

##### Shaft seal

- Two bi-directional mechanical seals in tandem arrangement, with liquid reservoir
- Leakage chamber

##### Impeller type

- Axial propeller in ECB design

##### Bearings

- Grease-packed rolling element bearings

## Materials

Overview of materials

Description	Material
Pump bowl	EN-GJL-200 (JL 1030)
Motor housing	EN-GJL-250 (JL 1040)
Shaft	1.4021 / 1.4057
Impeller	1.4517 (duplex stainless steel)
Casing wear ring	Stainless steel
Screws, bolts and nuts	Stainless steel

## Coating and preservation

### Paint

- **Surface treatment:** SA 2 1/2 (SIS 055900) AN 1865
- **Primer:** primer coat on unfinished casting
- **Top coat:** environmentally-friendly KSB standard coating (RAL 5002)

### Special coating

- Available on request (extra charge and a longer delivery period apply).

## Product benefits

- The pump's own weight ensures self-centring seating in the discharge tube, and an O-ring seals it; quick to install or remove.
- The slim motor minimises discharge tube flow losses.
- High reliability thanks to bearing temperature monitoring, vibration sensor, thermal motor protection, leakage sensors in the motor and connection space, and leakage monitoring of the mechanical seal system.
- Low-vibration hydraulic system; inlet ribs and optimised bellmouth for vortex-free inflow.
- Absolutely water-tight resin-sealed cable entries prevent any water from entering the motor – even in the event of a damaged cable.

## Acceptance tests / Warranties

### Functional test

- Every pump undergoes functional testing to KSB standard ZN 56525.
- Operating data is guaranteed to DIN EN ISO 9906 / 2 / 2B.

### Acceptance tests

- Acceptance tests to ISO/DIN or comparable standards are available against a surcharge.

### Warranties

- Quality is assured by means of an audited and certified quality assurance system to DIN EN ISO 9001.

## Selection information

### Information for pump selection

The guaranteed point of submersible pumps in discharge tubes is measured at a head 0.5 m above the motor (DIN 1184). The documented characteristic curves refer to this data. This must be taken into account when calculating system losses. The indicated heads and performance data apply to pumped fluids with a density  $\rho = 1 \text{ kg/dm}^3$  and a kinematic viscosity  $\nu$  of up to  $20 \text{ mm}^2/\text{s}$ .

The pump input power must be matched to the density of the fluid handled:

$$P_{2\text{req}} = \rho_{\text{fluid}} [\text{kg/dm}^3] \times P_{2\text{docu}}$$

The operating point with the largest pump input power is decisive for the operating range of the motor. To compensate the unavoidable tolerances of the characteristic curves of system, pump and motor we recommend selecting a motor size which provides sufficient power reserves.

Recommended minimum reserves<sup>1)</sup>

Required pump input power [kW]	Motor power reserve	
	Mains operation	With frequency inverter
< 30	10 %	15 %
> 30	5 %	10 %

### Intake chamber

Determine the minimum water level  $t_{1\text{min}}$  (diagram in general arrangement drawing):

The minimum water level  $t_{1\text{min}}$  is the water level required in the pump's suction chamber to ensure:

- that there is a sufficient liquid cover above the hydraulic system (propeller) (shown in diagram depending on pump size)
- that the pump does not draw in air-entraining vortices (shown in diagram depending on flow rate)
- that there is no cavitation in the hydraulic system (check against the  $\text{NPSH}_{\text{required}}$  value indicated in the technical literature).

The following conditions must be met:

- $\text{NPSH}_{\text{available}} > \text{NPSH}_{\text{required}} + \text{safety allowance}$
- $\text{NPSH}_{\text{available}} = 10.0 + (t_1 - t_3 - h_7/2)$
- Safety allowance:  
up to  $Q_{\text{opt}} \Rightarrow 0.5 \text{ m}$   
larger than  $Q_{\text{opt}} \Rightarrow 1.0 \text{ m}$

### Head (H)

The total pump head is composed as follows:

$$H = H_{\text{geo}} + \Delta H_v$$

$H_{\text{geo}}$  (static head)

- Without discharge elbow - Difference between suction-side water level and overflow edge
- With discharge elbow - Difference between suction-side and discharge-side water level

$\Delta H_v$  (losses in the system)

- Starting 0.5 m downstream of the pump: e.g. pipe friction, elbow, swing check valve, etc.

### Losses by inlet, riser and elbow

Losses are caused by the inlet, riser and elbow (or free discharge).

<sup>1)</sup> If larger reserves are stipulated by local regulations or are required to compensate for uncertain factors in system calculations, these larger reserves must be provided.

- Losses in the riser up to the indicated reference level (0.5 m above the motor) are taken into account in the documented characteristic curves.
- Inlet and elbow losses are system losses and must be taken into account for selection.
- For information on structural requirements, pump installation and pump sump design please refer to the KSB know-how brochure "Planning information: Amacan submersible pumps in discharge tubes" 0118.55.

**Programme overview / selection tables**

**Table of fluids handled**

The table below for your guidance is based on KSB's long-standing experience. The data are standard values and are not to be considered as generally binding recommendations. More detailed advice is available from our specialist department in Halle. Make use of our laboratory's wealth of experience when selecting materials.

Selection aid for material variants and fluid temperature per fluid

- Planning Information 0118.55

---

<sup>17)</sup> EPR = ethylene propylene rubber

**Data to be indicated in the purchase order**

- Designation of the pump
- Flow rate Q, head  $H_{total}$
- Head  $H_{total}$
- Type and temperature of the fluid pumped
- Voltage, frequency, starting method, cable length
- Quantity and language of operating manuals
- Required accessories
  - For discharge tubes indicate all required elevations and the type of installation.
  - For flow-straightening vanes indicate the type of installation and whether the design is with or without suction umbrella.
  - For a support rope indicate dimension "L", the number of additional lifting rings (depending on the lifting height of the hoisting tackle) as well as the elevations and type of installation.

1	Suspension arrangement attached to cover (or cross beam for BU/BG)
2	Lifting ring (standard, included in the scope of supply)
3	Optional (intermediate) lifting ring(s)
4	Lower edge of discharge tube = lower edge of pump

The support rope is an accessory and can be supplied with additional lifting rings and a support spacer (⇒ Page 47) as an option. The standard design is supplied without intermediate lifting ring(s).

Always define dimension "L" when ordering a support rope to allow the correct length to be determined. The lifting height of the crane must be taken into account when ordering a support rope. This determines the number of lifting rings required for installing the pump in or removing it from the discharge tube.

## Material variants

Overview of materials

Part No.	Description	G1	G3 <sup>18)</sup> (seawater variant)

Various	Screws/bolts		Stainless steel
99-16	Anode	-	Zn
Other materials on request.			

## Notes on material

### Duplex stainless steel (1.4517 or technically equivalent material)

This type of cast steel is resistant to cavitation, has excellent strength values and is used for high circumferential speeds. An excellent resistance to pitting corrosion makes ferritic-austenitic stainless steel a popular choice for pumping acidic waste water with a high chloride content as well as seawater and brackish water. Thanks to its good chemical resistance, e.g. also against waste water containing phosphorous and sulphuric acid, this material is used in a wide range of applications in the chemical industry and process engineering. Pumps made of duplex stainless steel have a very long service life, even when handling brines, chemical waste water (pH 1-12), grey water and landfill leachate.

**Installation types**

Overview of installation types

### **Scope of supply**

Depending on the model, the following items are included in the scope of supply:

- Pump set complete with 10 m power cable
- O-ring
- Back-up name plate
- **Accessories (optional):**
  - Support rope
  - Accessories for cable support
    - Spacer
    - Turnbuckle
    - Support spacer
    - Shackle
    - Cable clamps
  - Cable support sleeves
  - Flow-straightening vane to prevent floor vortices
  - Discharge tube in various designs (steel or GFRP)

**Accessories**

**Flow-straightening vane and intake chamber**

**Design of the intake chamber wall surfaces (to prevent vortex formation)**

The flow-straightening vane is indispensable for the inlet conditions of the pump set. It prevents the development of a submerged vortex (floor vortex) which could cause a drop in performance, for example. In addition, the floor and wall surfaces of the intake chamber should be designed as a rough concrete surface. Rough surfaces minimise the separation of boundary layers that may cause wall and floor vortices.

**Flow-straightening vane and intake chamber**

- The anti-vortex vanes in the bellmouth must be aligned with the flow-straightening vane.
- The bail of the pump is oriented in the same direction as the anti-swirl baffles in the bellmouth.

Installation position of the pump set

1	Bail
2	Anti-vortex vanes
3	Flow-straightening vane

Variant 1  
Flow-straightening vane cast from concrete

Variant 2  
Steel section

A	Bolted to the floor of the intake chamber
B	Flow-straightening vane centred beneath the discharge tube
C	Discharge tube
D	Intake chamber

**Support rope and turnbuckle in the discharge tube**

For large installation depths  
(with support spacer)

\*= The number of (intermediate) lifting rings depends on the lifting height of the hoisting tackle and on the building structure. (Intermediate lifting rings are supplied as an option).

List of components

Part No.	Description	Material
59-8	Turnbuckle	Stainless steel
59-17.2	Shackle	Stainless steel
59-47	(Intermediate) lifting ring(s)	Stainless steel
59-24	Rope, low rotation design	Stainless steel
720	Spacer	EPDM
59-17.1	Shackle	Galvanised steel (stainless steel optional)
59-7	Support spacer	GFRP

Cross-section of cable support

List of components

Part No.	Description	Part No.	Description
1	Cable clamp (approximately every 400 mm)	4	Support rope 59-24
2	Control cable	5	Spacer
3	Power cable	6	Clamp cover

Discharge tube cover with cable gland

Design: with welding sleeve

List of components

Part No.	Description
1	Discharge tube cover <sup>50)</sup>
2	Cover
3	Welding sleeve
4	Threaded bush with cable entry to DIN 22419 with strain relief and protection against kinking and twisting
5	Eyeplate for fastening the cable support (support rope)
6	Gasket, e.g. rubber with fabric reinforcement

**Design variant: with transit frame (up to 1 bar)**

List of components

Part No.	Description
1	Discharge tube cover <sup>51)</sup>
2	Transit frame (cable gland)
3	Packing and insert blocks
4	Cover segment with cable gland
5	Closed-cell profile joint in groove between the two cover parts
6	Sealing arrangement of groove between the two cover parts
7	Support brackets for cover segment with cable glands
8	Gasket (e.g. rubber with fabric reinforcement)

<sup>50)</sup> Discharge tube cover also available in split design.

<sup>51)</sup> Discharge tube cover also available in single-piece design.
